Ruby Air Operated
Diaphragm Pumps

Ruby Air Operated Diaphragm pumps

New pump line with a brand new designing that offers reinforced pumping potentials. The updated designing provides the possibility to use also other materials at the hydraulic parts without decreasing the efficiency in pressure. Plus, it offers even bigger performance provided with economy

Main features

Available in PP, PP+CF, PVDF+CF, ALUMINUM and STAINLESS STEEL 316

- Use in potentially explosive atmospheres (conductive series)
- Optimal performance
- Economical air consumption, ecological designing
- High efficiency for pressure/capacity
- Oil free operation
- No freezing
- New air valve designing, fully controlled air passing
- Easy disassembling and re-assembling
- New generation diaphragms with embodied inner-outer piston

II 2 G Ex h IIB T4 Gb
II 2 D Ex h IIIB 135°C Db
Bassefa15ATEX13DR/RN3

- New generation PTFE diaphragms of embodied type for long-life operation (compound)
- Advanced quality Full capacity PTFE-A diaphragms for high chemical and mechanical applications
- Potential to be submersible (on request)
- Possibility to be used in dirty environments due to their closed designing
- Easy manifold reverse
- Automatic suction
- Twin manifold option (two suction and two delivery)
- Excellent performance and value for money
- Ideal for abrasive, viscous, and shear sensitive media

How it works

The Ruby diaphragm pump is an air-operated, positive displacement, self-priming pump. These drawings show flow pattern through the pump upon its initial stroke. It is assumed the pump has no fluid in it, prior to its initial stroke.

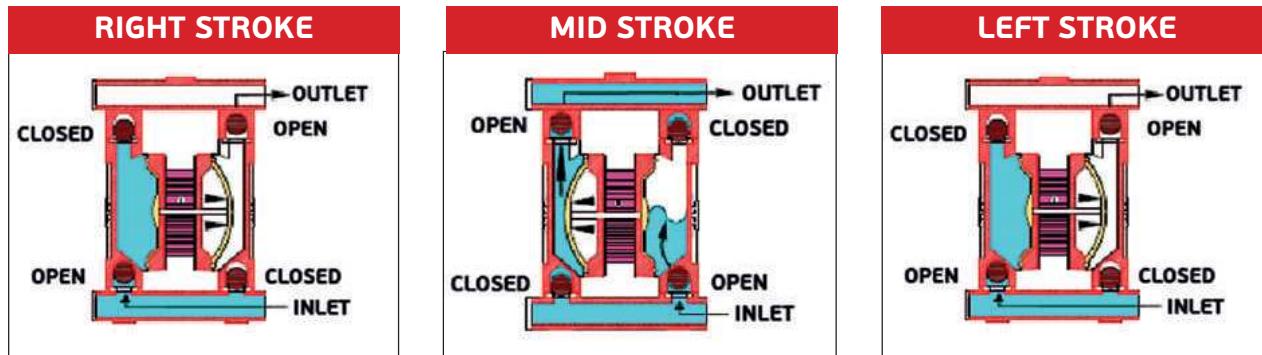

FIGURE 1 The air valve directs pressurized air to the back side of diaphragm A. The compressed air is applied directly to the liquid column separated by elastomeric diaphragms. The diaphragm acts as a separation membrane between the compressed air and liquid, balancing the load and removing mechanical stress from the diaphragm. The compressed air moves the diaphragm away from the center block of the pump. The opposite diaphragm is pulled in by the shaft connected to the pressurized diaphragm. Diaphragm B is on its suction stroke; air behind the diaphragm has been forced out to the atmosphere through the exhaust port of the pump. The movement of diaphragm B toward the center block of the pump creates a vacuum within chamber B. Atmospheric pressure forces fluid into the inlet manifold forcing the inlet valve ball off its seat. Liquid is free to move past the inlet valve ball and fill the liquid chamber (see shaded area).

FIGURE 2 When the pressurized diaphragm, diaphragm A, reaches the limit of its discharge stroke, the air valve redirects pressurized air to the back side of diaphragm B. The pressurized air forces diaphragm B away from the center block while pulling diaphragm A to the center block. Diaphragm B is now on its discharge stroke. Diaphragm B forces the inlet valve ball onto its seat due to the hydraulic forces developed in the liquid chamber and manifold of the pump. These same hydraulic forces lift the discharge valve ball off its seat, while the opposite discharge valve ball is forced onto its seat, forcing fluid to flow through the pump discharge. The movement of diaphragm A toward the center block of the pump creates a vacuum within liquid chamber A. Atmospheric pressure forces fluid into the inlet manifold of the pump. The inlet valve ball is forced off its seat allowing the fluid being pumped to fill the liquid chamber.

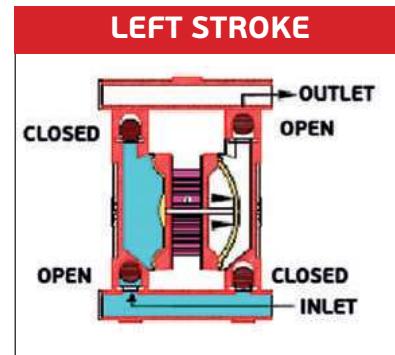

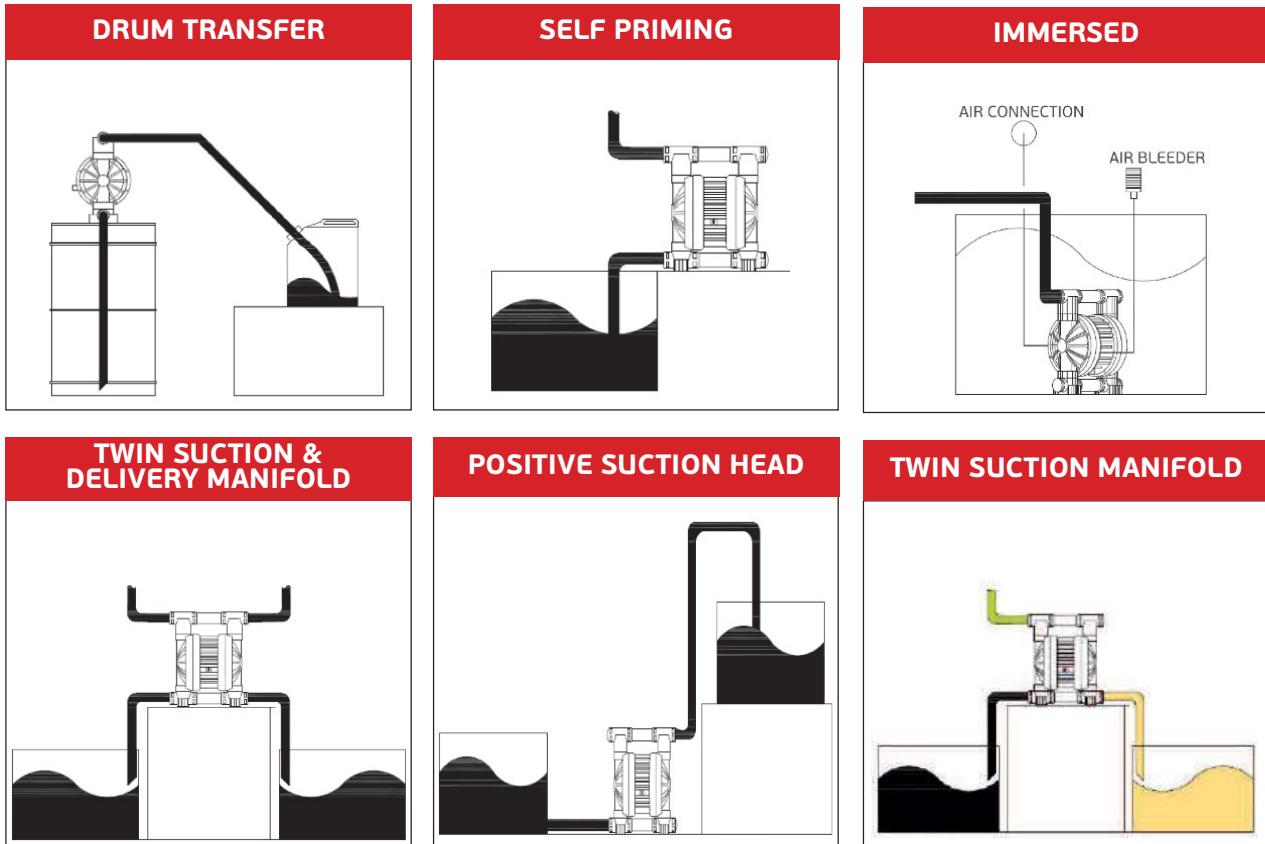

FIGURE 3 At completion of the stroke, the air valve again redirects air to the back side of diaphragm A, which starts diaphragm B on its exhaust stroke. As the pump reaches its original starting point, each diaphragm has gone through one exhaust and one discharge stroke. This constitutes one complete pumping cycle. The pump may take several cycles to completely prime depending on the conditions of the application.

Installation

ATEX Certificate

AlphaDynamic

PUMPS has stored the documentation certifying ATEX compliance according to Directive 2014/34/EC for it's ranges of Ruby air operated diaphragm pumps with the SGS Baseefa Limited certification body.

They are manufactured in a CONDUCT class II 2G h IIB T4 Gb and II 2D h IIIB 135°C Db.

The equipment user is responsible for classifying it's area

On the other hand, the manufacturer shall identify and affix the certification class of the manufactured equipment.

Advance Unified Diaphragms Featuring

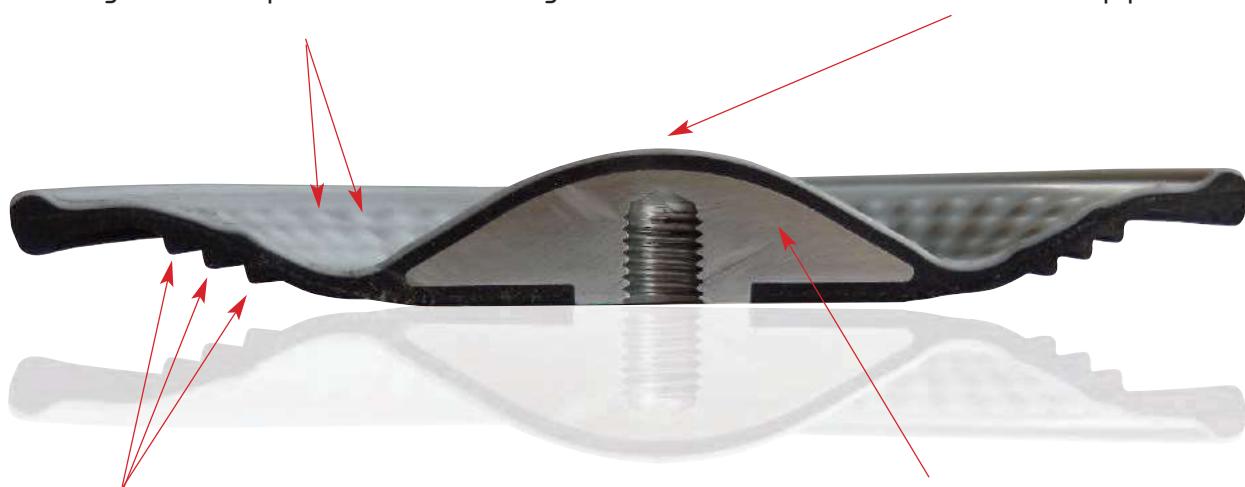

- ✓ Easy installation and maintenance
- ✓ Excellent service life
- ✓ Inventory cost reduction
- ✓ Improved performance
- ✓ Greater displacement per cycle
- ✓ No center hole, elimination of potential leak paths.
- ✓ There is no need for the main axis to be insured
- ✓ They can be screwed and unscrewed without the use of tools

Advance Unified Diaphragm Offers:

The prominences decrease
the stretching of the PTFE during
the regression and prevent it from cracking.

Exclusive conical shape
provides excellent service life,
suction lift and lower start-up pressure

Backing ribs sustain and guide
the diaphragm's flexibility for extended life
and reduced cavitation on suction stroke

Oversized integrated plate supports
nearly 50% of the diaphragm through
the entire dynamic motion.

Certifications

Quality Standards

AlphaDynamic PUMPS designs, develops and manufactures pumps and parts with the highest quality standards.

AlphaDynamic PUMPS consistently exceeds the expectations for service, quality and integrity, through its deep commitment to manufacture in compliance with all industrial certifications, including ISO Certification, CE Certification and Explosion Proof ATEX II 2G h IIB T4 Gb and II 2D h IIIB 135°C Db Certification.

AlphaDynamic PUMPS invests in employees and distributors/partners who are keen and willing to keep up with the company's philosophy for excellence, innovation and high customer service, creating and establishing all together a Great Brand. The Ruby Brand.
